

IPS MOBILE APP

Our mobile Android tablet application is designed with the individual inspector in mind for portability, efficiency, and ease of use. It synchronizes seamlessly with the data from our Integrated Property System (IPS) to provide real-time access to all the features needed to perform inspection duties in the field.

MAJOR FEATURES OF THIS SYSTEM INCLUDE

Calendar

All inspections can be viewed on the calendar to help determine the inspector's workload for the upcoming week, month, etc. Individual days can be selected to display the times and locations of inspections, making route planning a breeze. The mapping feature helps the inspector to identify unclear addresses and obtain directions from their current location.

Parcel Search

The built-in parcel search allows inspectors to bring up all parcel information contained in IPS. Searches can be performed by address, tax map number, or owner and business names. Parcel attributes can be displayed and contact information directly updated while on location.

The ability to search parcels in the field allows observed code enforcement cases to be entered with confidence that the issue has not already been reported.

Records

Additional record information such as violations, actions, checklists, and notes can be added to records or updated as needed. Attachments can easily be captured directly from the tablet's on-board camera and uploaded to the central IPS database. Records can now be identified via the Record Number search option.

Offline Access

All of the inspections, their respective records, and parcel data are cached locally on the tablet. Should cellular connection be lost at any time during the inspection, the app will still function and any changes made will automatically sync when service returns.
